The effects of the pandemic and the geopolitical turbulence are visible on higher energy costs and weak economic performance signalling a reverse of a trend on energy poverty that in 2020 started to increase in the EU after seven years of negative adaptations. Tackling this requires a better understanding of the social groups and territories affected most as well as relevant policy action. In this webinar we'll discuss what the Joint Research Centre and the Commission is doing on the issue, as well as provide insights on the latest data and energy poverty indicators available.

Webinar series: Energy poverty between research and actions
